#### **DETAILED ACTION**

### **Priority**

1. Receipt is acknowledged of papers submitted under 35 U.S.C. 119(a)-(d), which papers have been placed of record in the file.

### Claim Rejections - 35 USC § 112

2. The following is a quotation of the first paragraph of 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same and shall set forth the best mode contemplated by the inventor of carrying out his invention.

3. Claims 1, 2, 3, 4 are rejected under 35 U.S.C. 112, first paragraph, because the specification, while being enabling for (softening point/peak temperature), does not reasonably provide enablement for number-average and weight-average molecular weight. The specification does not enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to measure the molecular weigh of the polymer. The molecular weight of a binder resin may be measured by gel permeation chromatography (GPC). The binder resin is first in a solution of tetrahydrofuran and then measured.

## Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
  - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Art Unit: 1756

Claims 1-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Aoki et al. in view of Shirai et al. and Hashimoto et al. Aoki et al teaches a toner for electrophotography having a crystalline and amorphous polyester as the binder resin. The physical properties of the resin are softening point, heat of fusion and number-average molecular weight note Col. 6 lines 20-65. These properties are taught by Shirai who teaches the polycondensing monomers to obtain crystalline polyester. Hashimoto et al teaches a binder for a toner having a polyester and displaying a high and low molecular weight resin toner note Fig.1. The molecular weight is a GPC chromatogram for THF-soluble matter in the toner particle. It would be obvious to one of ordinary skill in the art at the time of applicants' invention with a reasonable expectation of success to use the binders with a known range of their molecular weights as shown in Hashimoto et al. in which the physical properties, low temperature fixability and high temperature anti-offset characteristics are part of the crystalline polyester of Aoki et al.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to John L Goodrow whose telephone number is 571-272-1384. The examiner can normally be reached on Monday -Friday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Mark F Huff can be reached on 571-272-1385. The fax phone number for the organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
